### MAJOR CRITERIA

By MRI:

- Regional RV akinesia or dyskinesia or dysynchronous RV contraction
- and 1 of the following:
  - Ratio of RV end-diastolic volume to BSA  $\geq 110$  mL/m<sup>2</sup> (male) or  $\geq 100$  mL/m<sup>2</sup> (female)
  - or RV ejection fraction  $\leq 40\%$

### MINOR CRITERIA

By MRI:

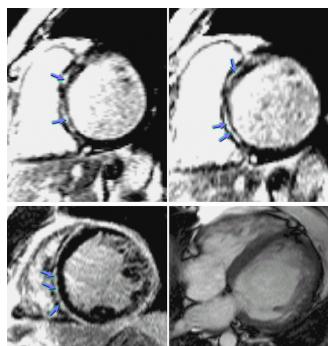

- Regional RV akinesia or dyskinesia or dysynchronous RV contraction
- and 1 of the following:
  - Ratio of RV end-diastolic volume to BSA  $\geq 100$  to  $< 110$  mL/m<sup>2</sup> (male) or  $\geq 90$  to  $< 100$  mL/m<sup>2</sup> (female)
  - or RV ejection fraction  $> 40\%$  to  $\leq 45\%$

RVEF: 39%  
RVEDVI: 136ml/m<sup>2</sup>

Choudhry et al, JACC 2008

## Noncompaction

HOUSTON Methodist  
DEBAKEY HEART & VASCULAR CENTER

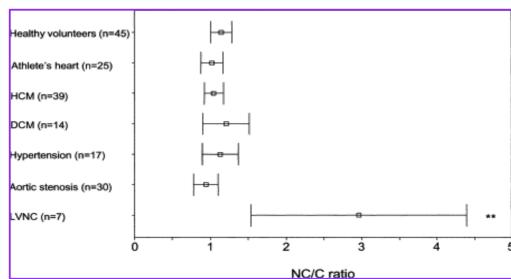

- LV End Diastolic Volume: 190 ml
- LV Ejection Fraction: 29%
- Noncompacted Myocardium (NC): 17 mm
- Compacted Myocardium (C): 6 mm
- Ratio NC/C: 2.8

@dipanjshah

## Noncompaction

HOUSTON Methodist  
DEBAKEY HEART & VASCULAR CENTER

A NC/C ratio of  $>2.3$  in diastole distinguishes pathological noncompaction, with values for sensitivity, specificity, positive, and negative predictions of 86%, 99%, 75%, and 99%, respectively.

**ORIGINAL ARTICLE**

## Prognostic Significance of Left Ventricular Noncompaction

Systematic Review and Meta-Analysis of Observational Studies

**See Editorial by Sharain and Anavekar**

**BACKGROUND:** Although left ventricular noncompaction (LVNC) has been associated with an increased risk of adverse cardiovascular events, the accurate incidence of cardiovascular morbidity and mortality is unknown. We, therefore, aimed to assess the incidence rate of LVNC-related cardiovascular events.

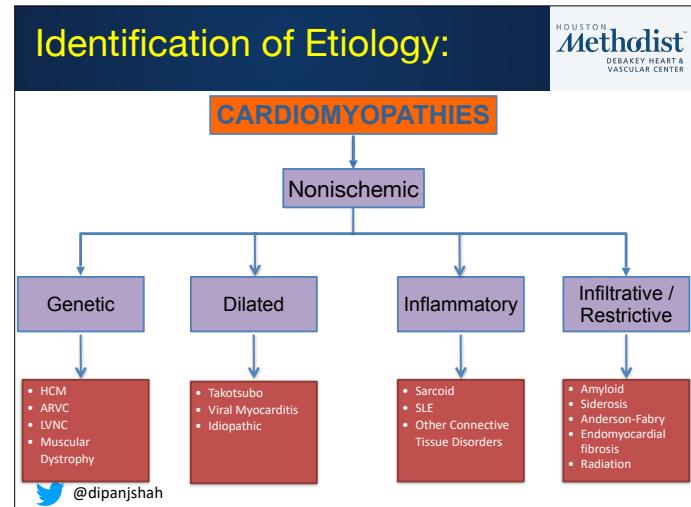

**METHODS:** We systematically searched observational studies reporting the adverse outcomes related to LVNC. The primary end point was cardiovascular mortality.

**RESULTS:** We identified 28 eligible studies enrolling 2501 LVNC patients (mean age, 46 years; male/female ratio, 1.7). After a median follow-up of 2.9 years, the pooled event rate for cardiovascular mortality was 1.9% (95% CI, 1.54–2.30) per 100 person-years. LVNC patients had a similar

**CONCLUSIONS:** Patients with LVNC carry a similar cardiovascular risk when compared with dilated cardiomyopathy patients. Left ventricular ejection fraction—a conventional indicator of heart failure severity, not the extent of trabeculation—appears to be an important determinant of adverse outcomes in LVNC patients.

Circ Cardiovasc Imaging. 2020

## Clinical Characteristics and Cardiovascular Magnetic Resonance Findings in Stress (Takotsubo) Cardiomyopathy

Ingo Etzel, MD

**Context:** Stress cardiomyopathy (SC) is a transient form of acute heart failure triggered by stressful events and associated with a distinctive left ventricular (LV) contraction pattern. Various aspects of its clinical profile have been described in small single-center populations, but larger, multicenter data sets have been lacking so far. Furthermore, it remains difficult to quickly establish diagnosis on admission.

**Objectives:** To describe the clinical presentation and evolution of SC in a large population, including those characterized by data from cardiovascular magnetic resonance (CMR) imaging; and to establish a set of CMR criteria suitable for diagnostic decision making in patients acutely presenting with suspected SC.

**Design, Setting, and Patients:** Prospective study conducted at 7 tertiary care centers in Europe and North America between January 2005 and October 2010 among 257 consecutive patients assessed at the time of presentation as well as 1 to 6 months after the acute event.

**Main Outcome Measures:** Complete recovery of LV dysfunction.

**Results:** Eighty-one percent of patients (n=207) were postmenopausal women, 8% (n=20) were younger women (aged  $\leq 50$  years), and 11% (n=29) were men. A stress trigger could be identified in 182 patients (71%). Cardiovascular magnetic resonance imaging data (available for 239 patients) revealed an epicardial pattern of regional wall motion abnormalities (n=197 [82%]), apical (n=81 [34%]), midventricular (n=40 [17%]), and basal (n=21 [1%]). Left ventricular ejection fraction was reduced (48% [SD, 11%]; 95% confidence interval [CI], 47%–50%) in all patients. The most common findings on CMR were apical ballooning (n=186 [78%]), a typical pattern of LV dysfunction, myocardial edema, absence of significant necrosis/fibrosis, and markers for myocardial inflammation. Follow-up CMR imaging showed complete normalization of LV ejection fraction (66% [SD, 7%]; 95% CI, 64%–68%) and resolution of regional wall motion abnormalities in all patients.

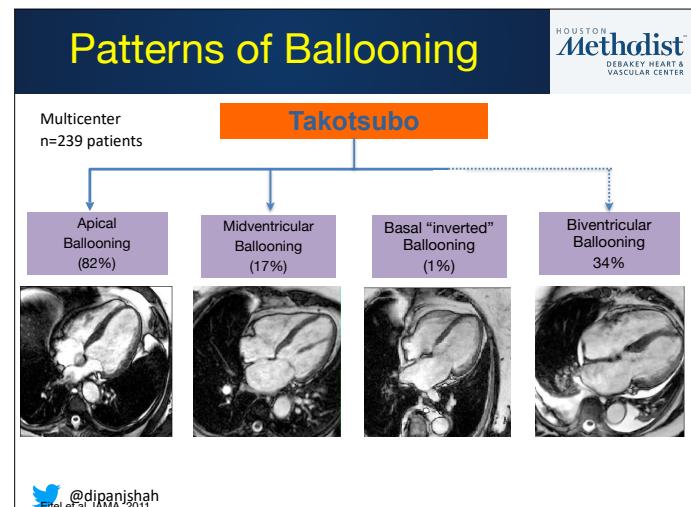

**Conclusions:** The clinical profile of SC is considerably broader than reported previously. Cardiovascular magnetic resonance imaging at the time of initial clinical presentation may provide relevant functional and tissue information that might aid in the establishment of the diagnosis of SC.

### B. Sudden cardiac death

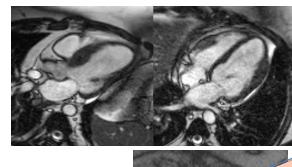

### C. Arrhythmic composite events

- Progressive increasing risk for SCD and arrhythmic composite events for both LVEF < 35% and also for LVEF > 35%.
- Risk plateaued ~ 20-25% scar burden.

Klem et al, Circulation 2021

## CMR FINDINGS: Summary

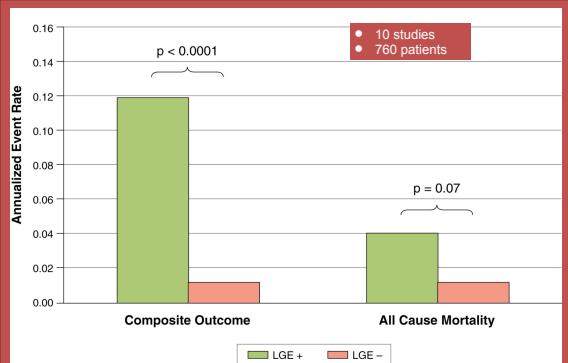

• Left ventricle: thickened basal septum, lateral wall, RV free wall  
 • Right ventricle: thickened basal septum, lateral wall, RV free wall  
 • Increased interstitial water content (edema) basal septum, lateral wall, RV free wall  
 • Hilar and paratracheal lymphadenopathy

Constellation of findings raise suspicion for cardiac sarcoidosis

### ANATOMIC PATHOLOGY DIAGNOSIS:

A. Heart, left ventricle outflow tract, biopsy:  
 - Non-necrotizing granulomatous inflammation present, focal  
 - No organisms identified on special stains for fungi and mycobacteria  
 - No polarizable foreign material identified  
 - Consistent with sarcoidosis in the appropriate clinical setting (see Comment)

## LGE and Annual Event Rates in Sarcoid

Coleman et al, JACC Imaging 2009.

## What is the Role of Imaging Sarcoid?

### Imaging

1. Unexplained Moritz II or 3rd degree AV Block (age < 60)  
 2. VT of unknown etiology  
 3. Heart Failure

1. Identify Cardiac Involvement  
 2. Establish Initial Diagnosis of Sarcoidosis

1. Between 16% and 35% of patients presenting with complete atrioventricular block (age < 60 years) or ventricular tachycardia of unknown etiology have previously undiagnosed CS as the underlying etiology.

2. CS as the underlying cause of heart failure:

• core LV biopsies at the time of LVAD → undiagnosed CS (3.4%)

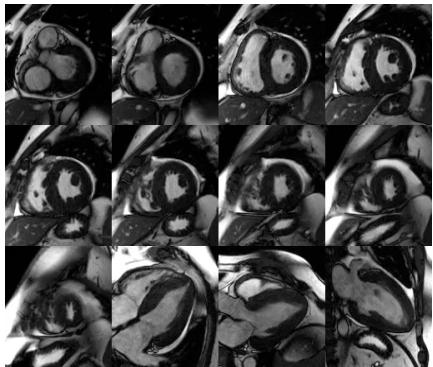

• Explanted hearts → 3% undiagnosed CS.

- Birnie et al, JACC 2014

@dipanjshah

## What is the most likely diagnosis ?

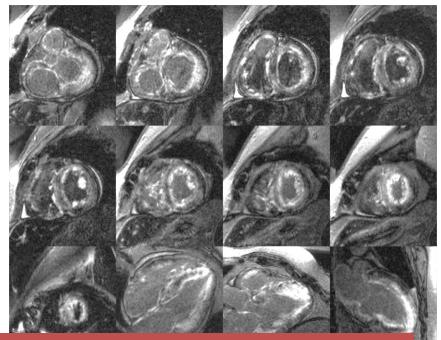

- Pericardial Effusion
- LV Wall Thickness: 1.6 cm
- RV Wall Thickness: 0.8 cm
- Biatrial enlargement
- LVEF: 47%
- RVEF: 38%
- LV Mass: 297 g
- LV Mass Index: 149 (58-91)
